

RAJNISH KUMAR PANDEY

SOFTWARE DEVELOPER

📍 knowledge park 2,greater noida, U.P 🌐 <https://rajnishxio.vercel.app/> 📧 rajnishpandey844@gmail.com

PROFILE INFO

Backend & AI Engineer specializing in distributed microservices, low-latency communication, and autonomous multi-agent systems. Experienced in decoupling monolithic applications using gRPC over HTTP/2, Apache Kafka event streaming, and LangGraph orchestration pipelines. Proven track record of building resilient backend architectures, real-time WebSocket systems, and production-ready RAG workflows.

EDUCATION

2024-2028
GCET, GREATER NOIDA, U.P

- Bachelor of Technology

SKILLS

- Distributed backends
- gRPC microservices
- Kafka pipelines
- Multi-agent systems
- LangGraph orchestration
- RAG architectures
- Node.js development
- Prisma ORM
- Docker containerization
- Scalable systems
- FastAPI backend development
- NoSQL database design
- MySQL relational databases
- Redis caching strategies

LANGUAGES

- C++
- Javascript
- Python

WORK EXPERIENCE

Uzence, Virtual

SEP 2025 - NOV 2025

Front End Development • Internship

- Engineered and shipped core UI component patterns (Comboboxes, Selects, Dropdowns, KBD) for an internal design system, enforcing accessibility standards across frontend applications.
- Optimized component rendering and state synchronization, lowering re-render frequency across key application flows.
- Collaborated directly with founding engineers to translate functional product specs into performant, production-ready UI components.

PROJECTS

E-Commerce Microservices Backend

- Architected a containerized microservices ecosystem across 6 domain services (User, Product, Cart, Order, Payment, Inventory) orchestrated with Docker Compose.
- Implemented an API Gateway routing client HTTP requests to inter-service gRPC endpoints, achieving low-latency service-to-service communication.
- Integrated Apache Kafka event streams to handle asynchronous order processing and dynamic inventory reconciliation without blocking the main event loop

KathaAI | AI-Powered Heritage Storytelling & Video Generation Platform

- Architected KathaAI, an end-to-end heritage storytelling platform using FastAPI, LangGraph, and Next.js to transform text prompts and audience personas into short-form educational videos.
- Engineered a multi-agent backend pipeline orchestrating automated web scraping, LLM-based fact extraction, dialogue scripting, AI image retrieval, and multilingual TTS voice synthesis.
- Automated media composition and rendering, integrating dynamic visual matching with localized storage and archival search to deliver persona-tailored, historically grounded video narratives.

Jagruk Janta Jaankari

- Engineered a location-aware backend featuring Redis geofencing and LocationIQ boundaries to query regional civic data.
- Implemented LLM orchestration pipelines via LangChain and automated Web Scraping to generate location-specific civic reports on demand
