PROFILE INFO

I build high-performance distributed backends and autonomous AI architectures. My expertise lies in decoupling monolithic structures into scalable microservices using gRPC for low-latency communication and Apache Kafka for event-driven workflows. On the AI front, I engineer production-grade multi-agent reasoning loops and complex RAG pipelines using LangGraph, focusing on deterministic tool execution and multi-hop reasoning. I write clean, resilient code to build robust systems that scale.

EDUCATION

2024-2028
GCET, GREATER NOIDA, U.P

- Bachelor of Technology

SKILLS

- Distributed backends
- gRPC microservices
- Kafka pipelines
- Multi-agent systems
- LangGraph orchestration
- RAG architectures
- Node.js development
- Prisma ORM
- Docker containerization
- Scalable systems
- FastAPI backend development
- NoSQL database design
- MySQL relational databases
- Redis caching strategies

LANGUAGES

- C++
- Javascript
- Python

WORK EXPERIENCE

Uzence, Virtual

SEP 2025 - NOV 2025

Front End Development • Internship

- Built reusable UI components like dropdowns, comboboxes, selects, and KBD as part of an in-house AI library.
- Implemented clean, scalable frontend architecture ensuring component consistency, accessibility, and performance.
- Collaborated with founders and designers to translate product requirements into functional UI interactions.

PROJECTS

Jagruk Janta Jaankari

- Built a location-aware civic accountability app with FastAPI backend and Next.js frontend.
- Implemented Redis geofencing, MongoDB storage, Selenium scraping, and LocationIQ-based boundaries.
- Integrated LLM workflows with Ollama and Groq to auto-generate civic awareness reports in real time.

Real-Time Queue Management System

- Built a real-time patient queue management app for clinics with Next.js, FastAPI, and Redis Pub/Sub.
- Implemented secure receptionist authentication with JWT, passphrase-based login, and protected WebSocket actions.
- Added live waiting-room display with active token, upcoming queue, and dynamic wait-time estimates across screens.

E-Commerce Microservices Backend

- Built a microservices-based e-commerce backend in Node.js/TypeScript with gRPC APIs and Docker Compose orchestration.
- Designed an API gateway that routes HTTP requests to user, product, cart, order, payment, and inventory gRPC services.
- Used Prisma with PostgreSQL and MongoDB plus Kafka events to support scalable orders, inventory, and cart workflows.
